

PROFESSIONAL SUMMARY

- Electronics and Communication Engineering graduate with hands-on experience in machine learning using Python and Scikit-learn. Skilled in data preprocessing and building basic classification models. Looking for an entry-level opportunity to apply my skills and grow in a professional environment.

SKILLS

- **Programming Languages:** Python (Core + Advanced), Object-Oriented Programming (OOP)
- **Machine Learning:** Supervised Learning, Unsupervised Learning, Logistic Regression, Classification Models, Model Evaluation, Confusion Matrix
- **Libraries & Frameworks:** NumPy, Pandas, Scikit-learn, Matplotlib, Seaborn
- **Data Handling:** Data Preprocessing, Feature Engineering, Exploratory Data Analysis (EDA), Data Cleaning, Feature Selection
- **Databases:** MySQL, SQL (Joins, Subqueries, Normalization)
- **Tools & Platforms:** Git, GitHub (Basics), VS Code, Google Colab, Jupyter Notebook

EDUCATION

Bachelor of Technology in Electronics and Communication Engineering	2021–2025
CIET, Guntur	CGPA: 6.61/10.0
Senior Secondary Class XII	2019–2021
Sri Chaitanya Junior College	59.40%
Secondary Class X	2019
State Board of Andhra Pradesh	82%

PROJECTS

- **Fraud Detection System**

Python, Pandas, Scikit-learn, Streamlit

Dec 2025 – Feb 2026

GitHub

 - * Developed a machine learning model to detect fraudulent financial transactions based on transaction details such as amount, account balances, and transaction type.
 - * Collected and processed input features including sender and receiver balance information to understand transaction behavior.
 - * Used pandas and NumPy libraries for efficient data preprocessing, cleaning, and handling of structured transaction data.
 - * Applied Logistic Regression algorithm to classify transactions as fraud or non-fraud based on learned patterns.
 - * Split the dataset into training and testing sets to ensure proper model validation and avoid overfitting.
 - * Evaluated the model performance using accuracy score and confusion matrix to understand prediction results.
 - * Saved the trained model using joblib to enable reuse without retraining the model every time.
 - * Built an interactive web application using Streamlit to allow users to input transaction details easily.
 - * Displayed prediction results clearly in the interface, indicating whether the transaction is fraudulent or safe.
- **Diabetes Prediction System**

Python, Pandas, Scikit-learn

Jan 2026 – Mar 2026

GitHub

 - * Built a machine learning model to predict whether a person has diabetes based on medical input features such as glucose level and BMI.
 - * Performed data cleaning and preprocessing by handling missing values and preparing the dataset for model training.
 - * Used pandas and NumPy libraries for data manipulation, analysis, and efficient handling of medical data.
 - * Applied Logistic Regression algorithm to perform binary classification for predicting diabetes outcome.
 - * Divided the dataset into training and testing sets to evaluate the model performance on unseen data.
 - * Evaluated model accuracy and used confusion matrix to understand correct and incorrect predictions.
 - * Applied feature scaling techniques to normalize the data and improve model performance.
 - * Analyzed relationships between different features using basic exploratory data analysis techniques.

CERTIFICATIONS

- **Meta**,GenAI in Data Analytics

2025
- **Infosys Springboard**,Python Programming

2025
- **HackerRank**,SQL (Basic)
- **HackerRank**,Python (Basic)
