

PROFESSIONAL SUMMARY

- Electronics & Communication Engineering graduate skilled in building AI-powered applications with Python, FastAPI, LangChain, and the Google Gemini API. Hands-on experience shipping end-to-end projects covering RAG pipelines, vector search (FAISS), REST API design, and NLP-based scoring systems. Seeking an internship/entry-level role in AI/ML or Backend Engineering to apply strong fundamentals in application architecture and rapid prototyping.

SKILLS

- **Languages:** Python, SQL
- **AI/ML & NLP:** LangChain, Google Gemini API, Retrieval-Augmented Generation (RAG), FAISS, Sentence Transformers, Prompt Engineering, Scikit-learn
- **Backend & APIs:** FastAPI, REST API Design, JSON, Object-Oriented Programming
- **Data & Frameworks:** Pandas, NumPy, Streamlit
- **Database:** MySQL
- **Tools:** Git, GitHub, VS Code, Jupyter Notebook

PROJECTS

- **Smart Resume-JD Matcher** Aug 2026 – Sep 2026
Python, Streamlit, Sentence Transformers, Scikit-learn, pdfplumber, NLP Live Demo
 - Built and deployed a Streamlit application that analyzes resumes against job descriptions and generates a semantic match score.
 - Developed a PDF processing pipeline using pdfplumber to extract, clean, and normalize unstructured resume text for analysis.
 - Implemented semantic similarity using Sentence Transformers and cosine similarity to compare resume and job description content.
 - Developed a skill-gap analysis module to identify relevant and missing technical skills by comparing extracted skills from resumes and job descriptions.
 - Added role-based recommendations to help users improve resume alignment with specific job descriptions and structured the application into modular components for text processing, skill extraction, and scoring.
- **Intelligent Document Search & Question Answering System** Apr 2026 – May 2026
Python, FastAPI, LangChain, Google Gemini API, FAISS, Streamlit GitHub
 - Built a full-stack RAG application enabling natural-language Q&A over uploaded PDF documents, combining a FastAPI backend with a Streamlit front end.
 - Designed a document ingestion pipeline that chunks text, generates embeddings, and indexes them in FAISS to support similarity search across document content.
 - Implemented a Retrieval-Augmented Generation workflow using LangChain and Google Gemini API to generate answers grounded in retrieved document context.
 - Exposed modular REST APIs with FastAPI for document upload, indexing, retrieval, and Q&A functionality.
 - Structured the codebase into independent modules for document ingestion, retrieval, API handling, and response generation to support maintainability and future testing.
- **Diabetes Prediction System** Feb 2026 – Mar 2026
Python, Pandas, Scikit-learn GitHub
 - Built a binary classification model using Logistic Regression to predict diabetes risk from patient health data.
 - Performed data cleaning, preprocessing, feature scaling, and exploratory data analysis using Pandas and Scikit-learn.
 - Analyzed feature distributions and relationships with the target variable to prepare the dataset for model training.
 - Evaluated model performance using accuracy and a confusion matrix to assess classification results.

EDUCATION

- **Chalapathi Institute of Engineering And Technology, Guntur** 2021 – 2025
Bachelor of Technology – Electronics & Communication Engineering CGPA: 6.61/10.0

CERTIFICATIONS

- **Meta**, GenAI in Data Analytics 2025
- **Infosys Springboard**, Python Programming 2025
- **HackerRank**, SQL (Basic) 2025
- **HackerRank**, Python (Basic) 2025
